

University of the future for sustainable development

Higher education institutions (HEIs) are workshops of the future for sustainable societies. In teaching and research, they develop knowledge, technology and innovative responses to the complex challenges we face, both now and in the future. Their internal structures serve as models of best practice in giving young people a tangible experience of sustainable thinking and behaviour.

HEIs operate globally and have a regional impact. They work closely with stakeholders from the areas of politics, business and civil society. They cooperate on the international stage, work in an interdisciplinary manner, and encourage people to see matters from a different perspective. At the same time, they prepare students for the world of work, which is evolving more rapidly than ever.

HEIs train tomorrow's leaders and professionals. Through inclusive access and diversified education programmes and advisory services, they ensure equality of opportunity. To achieve this, they use processes and instruments of mobile learning and digitalisation, and by doing so, contribute to making education for all a reality.
